The guarantors are Danish regional and local banks that at the same time are shareholders of DLR Kredit A/S.

Legal framework for valuation and LTV-calculation follow the rules of the Danish FSA - Bekendtgørelse nr. 687 af 20. juni 2007

Describe the method on which your LTV calculation is based

LTV is calculated on each property on a loan-by-loan basis, and takes into account prior-ranking loans at fair values relative to the estimated property value based on the most recent valuation or approved market value.

Fair value of the loan distributed are shown utilising LTV bracket intervals. The intervals become smaller as the percentage approaches par. Table M4a and M4b distribute the loan continuously from the lower LTV bracket to the upper brackets relative to fair value of the collateral, whereas in table M4c and M4d the entire loan is placed in the highest LTV bracket ("marginal distribution").

Example on continuously distribution into LTV brackets for a loan with fair value of 75 per cent

This example loan will be distributed with 20 per cent of the value into the lower three brackets; 10 per cent in the fourth bracket and the remaining 5 per cent of the value in the last bracket.

Loan-to-value (distributed continuously)											
0-19.9	20-39.9	40-59.9	60-69.9	70-79.9	80-84.9	85-89.9	90-94.9	95-100	>100		
20	20	20	10	5	0	0	0	0	0		

Example on marginal distribution into LTV brackets for a loan with fair value of 75 per cent

In this case, the loan will be distributed with 100 per cent into the fifth bracket (70-79.9)

To Contents

For mortgage loans funded by the issuance of "Særligt Dækkede Obligationer" (SDO), revaluation of collateral must be carried out on an ongoing basis in order to ensure that the value of the cover asset at least matches the value of the issued SDOs at any time. Residential properties must be revaluated at least once every third year, whereas commercial and agricultural properties must be revaluated at least once a year. In times of larger fluctuations in property prices, extraordinary LTV surveillance must take place.

Should the LTV on an individual loan increase beyond the legal maximum, fx due to falling property prices, the mortgage institute must inject additional collateral into the cover pool to secure full collateral coverage.

Frequency of collateral valuation for the purpose of calculating the LTV

Subordinated debt nal tier 1 capital (e.g. hybrid core capital) Hybrid Tier 1 capital (perpetual debt instruments). Equity capital and retained earnings. Core tier 1 capital General explanation Table G3 General practice in Danish market The general balance principle does not require a one-to-one balance between the loan and the bonds issued. This gives the credit institution a wider scope for taking liquidity risk than the more strict specific balance principle. General balance principle The specific balance principle ensures a one-to-one balance between loans and bonds issued, and is used for the issuance of SDRO, SDO and RO bonds Specific balance principle The specific balance principle de facto implies full cash flow pass through from borrowers to investors. Under this principle daily loan origination is continuously tapped into the market, and the individual borrower loan rate is determined directly by the bond sales price for the corresponding financing amount of bonds. All borrower payments of interest and principal market the interest and principal payments to investors exactly (borrower payments fall due one day prior to the payments to investors). Redemptions take place by borrowers' buy bact the financing bond in the market at market price, or (for callable bonds) by calling the bond at par. In the latter case the borrower prepayment match the bond draw down. Market risks are thus eliminated under this issuance model (i.e. interest rate risk, prepayment risks, liquidity risks and funding risks). Further, asset substitution is not possible under this General explanation Table G4 General practice in Danish market One-to-one balance between terms of granted loans and bonds issued, i.e. daily tap issuance? Mortgage banks issue and sell bonds to investors, who then fund the loans. During the loan term, borrowers make principal and interest payments to mortgage banks which transfer the amounts to investors. Mortgage banks charge a margin from the borrower to cover daily operating costs, potential losses, and to make a profit. The margin is a percentage of the outstanding debt which the borrower past throughout the loan term. The margin rate corresponds to the interest margin of a but is generally lower. The issuance is made on a daily Pass-through cash flow from borrowers to investors? Yes, the mortgage bank is an intermediary between persons requiring loans for the purchase of real properties and investors funding the loans by purchasing bonds Asset substitution in cover pool allowed? General explanation Table M1-M5 Owner-occupied homes Holiday houses Subsidised Housing Cooperative Housing General practice in Danish market Newton practice in Joinson Imakes

Private owned residential properties used by the owner, Max LTV 80 % (legislation).

Holiday houses for owner's own use or for subletting, Max LTV 60 % (legislation),

Residential rental properties subsidised by the governemt. Max LTV 80 % (legislation), LTVs above 80 % can be granted against full government guarantee.

Residential property owned and administered by the cooperative and used by the members of the cooperative. Max LTV 80 % (legislation).

Residential property rented out to private tenants. Max LTV 80 % (legislation).

Industrial and manufacturing buildings and warehouses for own use or for renting. Max LTV 60 % (legislation).

Office property and retail buildings for own use or for rent. Max LTV 80 % (legislation).

Property and land for agricultural use. Max LTV 70 % (legislation). Lending from 80 - 70 % LTV however only against additional collateral.

Property used for equiration, Kindervardees, missings, and other buildings for null use. Max LTV 70 % (legislation). Private rental Manufacturing and Manual Industries Office and Business Agriculture Social and cultural purposes Property used for education, kindergardens, museums and other buildings for public use. Max LTV 70 % (legislation). Property, that can not be placed in the categories above, fx unused land or green energy plants. Max LTV 70 % (legislation). General practice in Danish market These are loans where instalments and outstanding debt are adjusted with the development of an index which typically reflects trends in consumer prices. The loan type was introduced in Denmark in 1982. All Danish index loans have semi-annual payment dates (January 1st and July 1st). Index loans are offered as cash loans. The maturity depends on the loan type. Especially the maturity for subsidized housing depends on the size of the future inflation rate.

The long-term – typically 30-year – fixed-rate, callable loan is considered the most traditional Danish mortgage loan. With this loan, the borrower knows in advance the fixed repayr throughout the term of the loan. The long-term fixed-rate mortgage loan has a prepayment option which may be exercised in two ways, i.e. the borrowers may prepay their outstar debt at a price of 100 (par) or the borrowers may purchase the underlying bonds in the financial markets and deliver them to the mortgage bank. This loan type is also offered with Fixed-rate loans

Adiustable Rate Mortgage

Adjustable-rate mortgages (ARMs) were introduced in 1996, and the main advantage of ARMs is that interest rates are generally lower than those of fixed-rate loans, when the loan is raised. The interest rate is generally reset at a frequency of 1, 3, 5 or 10 years, and the underlying bonds are then replaced by new bonds. The yield of the new bonds determines the loan rate for the period until the next interest rate reset. The lower initial loan rate should therefore be weighed against the risk that it will increase during the loan term.

An ARM may be prepaid at a price of 100 in connection with each interest rate reset. Alternatively, the borrower may prepay the loan by purchasing the bonds on market terms – as with all mortgage loans. This loan type is also offered with interest-only periods.

The loan rate is generally fixed for 3 or 6 months. In addition, this loan type differs from ARMs as the interest rate is linked to a reference rate, i.e. an interest rate determined in the money market. The reference rate of DKK-denominated loans is CIBOR (Copenhagen Interbank Offered Rate) or CITA (Copenhagen Interbank Tomorrow/Next Average), an interest rate which is quoted daily by OMX NASOAD. This loan type is also offered with interest-only periods.

These are loans where the rate changes at generally three or six months. The reference rate of DKK-denominated loans is CIBOR (Copenhagen Interbank Offered Rate) or CITA (Copenhagen It is possible to get a loan with a floating interest rate which cannot exceed a certain level (cap). In this way, the borrower hedges against major interest rate increases. If a loan has a cap Any other loan types, which not comply with the above mentioned.

General practice in Danish market ning defined by duration of customer relationship, calculated from the first disbursement of a mortgage loan.
